(Feb 1, 2014, Version: 1)

In Astrology, “Transit” word is very commonly used. Simply, we consider “Daily Progression” of Planet by means of Transit i.e. “Angular Distance” travelled by (Longitude) each Planet with respect to Sun in Zodiac. So, “Transit” word simply compromise “Angular Distance” travelled by a Planet. In Vedic tradition, we follow Sidereal Longitude.

Before going directly on Triple Transit, we have to understand the following basic concepts. Earth is a part of Solar system, where including Earth, all planets rotate around Sun. Further, Sun rotates in Zodiac with its Solar system. We live on Earth, so when we look on Sky, we found our self as in center of solar system where Sun and all other Planets seem rotating around the earth, which is a hypothetical phenomenon. When we consider Sun as Center- this method/terminology is known a “Heliocentric system”. When we consider Earth is centre of our Solar System we call it is “Geo centric system”.

In our solar system, Sun acts as the centre point of Solar system, where all planets rotate around the Sun. Each planet has fixed path of it rotation around the Sun and every Planet always moves in a particular direction around the Sun. Between Sun & Earth, there are two Planets: Mercury and Venus, which are also known as “Interior Planets”. When look on interior Planets from earth with respect to Sun, Mercury can go away from Sun up to 18 to 28 Degrees angular distance, while Venus can go up to 45 to 48 degrees.

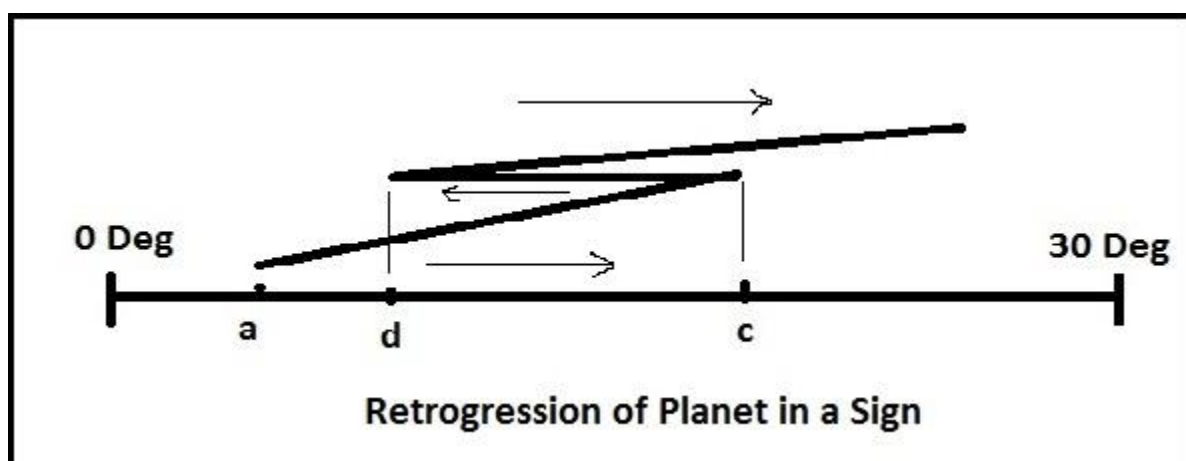

Exterior Planets: On exterior of Earth, there are Mars, Jupiter and Saturn. These are known as Exterior Planets. Moon is satellite of Earth where he acts as both Interior as well Exterior Planet, but Moon is too much close to Earth in respect of other Planets. This too much closeness results in Eclipse on Earth. Though other Planets also cause Eclipse, but their Shadow is too small to be seen difficult.

Retrogression: No one Planet goes retrograde in reality, while transiting around the Sun, but it's a relative view (apparent motion) by which we see planet/s going retrograde and direct from Earth. This Retrogression is given much weightage in Vedic Astrology and has much saying on Mundane as well as on Natal Horoscopy.

Sun & Moon never go retrograde, while Rahu & Ketu are always retrograde. Remaining 5 planets: Mercury, Venus, Mars, Jupiter and Saturn go retrograde. Approximate durations are:

- Mercury goes retrograde for 24 days and remains stationary apprx. 1 day before & after.
- Venus goes retrograde for 42 days and remains stationary apprx. 2 days before & after.
- Mars goes retrograde for 80 days and remains stationary apprx. 2 or 3 days before & after.
- Jupiter goes retrograde for 120 days and remains stationary apprx. 4 days before & after.
- Saturn goes retrograde for 140 days and remains stationary apprx. 4 days before & after.

Retrogression & “Triple Transit” concept: Triple Transit was well known to Nadi Astrologers and they used it very accurately in predictive astrology at Mundane and individual Nativity. “Retrogression is itself a Triple Transit”. See in below picture:

Retrogression of a Planet may occur within a Sign or in between two Signs. The transiting Planet like in above picture from 0 degree onward moves

normal up to point “c”. Because of retrogression phenomenon, when from point “c”, the planet goes retro and moves back up to “d”: this phase is known as “Retrogression Phase”. From point “d”, planet become direct and again starts moving towards point “c” and onward. So, from above picture we can easily understand the concept of Retrogression and its influential area. **Here, the actual area, which falls under retrograde impact is: From point “d” to point “c”.**

Where to apply:

- Effective on both Charts: Lagna as well Divisional Charts.
- Natal Planet/s as well as Transit Planet/s, who falls on the path TT (like in above picture: in between the area (from point “d” to point “c”) will produces very uncertain and quick impacts/results.
- A Vargottma Planet faces more impact of TT, in compression of other Planets.
- Saturn’s TT over Vargottma Sun is harmful for Father.
- Saturn’s TT over Vargottma Moon is harmful for Mother.
- Same way, we can check for Mercury, Venus, Mars and Jupiter’s TT over different Natal Planet/s.

The above said points are in general. Like, Saturn’s TT over Vargottma Sun is harmful for Father- is a general statement. Why astrological rules get failed in many cases? For this, we have to understand the basic concept of Science i.e. Static and Dynamic conditions. Like a metal wire will exert different “resistances” to the flow of “electric current”, when tested at different temperatures. This difference in temperature i.e. two different states influenced the resistance properties of the same metal. Astrology is a Dynamic Science, where conditions never remain same. Only Natal position of Planets remains fixed, but each time these positions are studied under mutual impact of Dasa and Transit. Natal Position is Static while Das and Transit are Dynamic factors.

Remember:

- “Most of the Rules are of Static Nature”.
- “Natal chart is of Static Nature”.
- “Dasa & Transit are of Dynamic Nature”.

Next version will be updated soon with examples.
